## PAJUNK®

# E-Cath according to Tsui

The revolutionary technique for continuous peripheral nerve blocks

1111

## Simple, safe, quick<sup>1</sup> Continuous peripheral regional anaesthesia with E-Cath

*E*-Cath, a joint development from Dr. Ban Tsui and PAJUNK<sup>®</sup>, gives new impulses for regional anaesthesia. This set is as easy to use as the Single Shot Technique and the positioning of the catheter can be carried out by one person in a few work steps.<sup>2</sup> In addition the outstanding visibility of cannula and catheter under ultrasound monitoring as well as the option for combining with electrical stimulation (dual guidance) increases the safety of precise nerve localization.<sup>3</sup>

1 Shakespeare, Tsui, Catheter-over-needle method ..., 2013; 60: 948-949

- 2 Ip, Tsui, The catheter-over-needle assembly ..., 2013; 693
- 3 lp, Tsui, The Safety of an interscalene ..., 2013; 68: 774-775

### Procedure

- Puncture with the SonoPlex cannula and indwelling cannula connected with the FixClip
- The indwelling cannula is uncoupled by a 90° twist and the SonoPlex cannula is retracted

	The advantages of E-Cath at a glance:				
	Positioning is as easy as the Single Shot Technique				
PATENT PENDING	<b>2</b> Echogenicity of cannula and catheter: The ultrasound visibility is increased due to the SelfPriming System				
	<b>3</b> <i>Electrical stimulation</i> can optionally be used alone or in combination with ultrasound (dual guidance)				
	<b>4</b> Soft catheter tip for more comfort and safety				
	5 <i>"Catheter over Needle" Technique</i> reduces the risk of leakage and dislocation to a minimum				
	<b>6 Double layered design of E-Catheter and indwelling cannula</b> enables an unhindered flow of the anaesthetic				
	7 The combination of a <b>lateral and central opening of the E-Catheter</b> also ensures the continuous flow				
PATENT PENDING	8 E-Catheter with integrated injection tube and Luer Lock Connection replaces the clamping adapter				

The E-Catheter is introduced via the indwelling cannula

⇒ and fixed in the indwelling cannula via the Luer Lock Connection

## As easy as the Single Shot The E-Cath puncture technique

The main advantage of the Single Shot Technique is that its performance is simple but not time-consuming.<sup>4</sup> It is exactly these benefits that the E-Cath combines together with simple access for the catheter in a set.

### The E-Cath set consists of the following components:

- SonoPlex cannula with indwelling cannula
- E-Catheter with connected injection tube (SelfPriming System)
- Filter 0.2 µm
- FixoLong for filter fixation

NEW: The FixClip ensures a fixed connection between the cannula and the indwelling cannula. In this way the indwelling cannula can be held at the shaft during the puncture.

- → As easy as the Single Shot Technique
- Outstanding reflection properties due to Cornerstone Reflectors and SelfPriming System
- Double safety thanks to "dual guidance"
- Few work steps third hand problem solved
- NEW: FixClip ensures a fixed connection between SonoPlex cannula and indwelling cannula

The SonoPlex cannula is introduced with the indwelling cannula and an appropriate solution is injected. Thereby the cannula can - due to FixClip – be held as well at the hub as at the shaft. The localization of the cannula takes place under ultrasound monitoring and can be combined optionally with electric stimulation. The indwelling cannula is subsequently used as an access system for the E-Catheter.

SonoPlex cannula with facet tip in indwelling cannula

+

### **Cornerstone Reflectors**

The distal end of the SonoPlex cannula has two embossed sections of 10 mm length each. Accordingly, the ultrasonic waves are reflected over a total length of 20 mm.

### PATENT PENDING

10 mm

### SelfPriming System

The SonoPlex cannula has a lateral opening. When a solution is injected, it does not only flow through the central opening but also laterally between the cannula outer wall and indwelling cannula. A patent is pending for this SelfPriming System.

### **Outstanding visibility**

A glance at the ultrasound image clarifies: Thanks to the liquid layer, the Cornerstone Reflectors can fully exploit their echogenic properties.

## Quickly positioned and safely anchored The positioning of the E-Catheter

The E-Catheter is positioned through the indwelling cannula in a few work steps.<sup>5</sup> This ultrasound-guided "Catheter over Needle" Technique (CON-Technique) can be performed by the anaesthetist alone.<sup>6</sup> As the cannula diameter is smaller than the catheter diameter, the diameter of the insertion point is also smaller.<sup>7</sup> This involves another positive aspect of this CON-Technique – namely the minimization of the risk of leaks and dislocation.<sup>8</sup>

### **Safe flow** The stable design of the E-Catheter is enhanced by the indwelling cannula and increases the flow safety.

The catheter has a high degree of flexibility during infusion. The unhindered flow of anaesthetic is simultaneously guaranteed.

### Soft tip

The catheter has a soft tip. ➡ This means an increase in comfort and safety for the user and patient.

"Catheter over Needle" Technique The needle puncture hole is sealed by the "Catheter over Needle" Technique. ⇒ This contributes to the minimization of the risk of leakage or dislocation.

## Echogenic and reliable Continuous blocks with the E-Catheter

What applies for the SonoPlex cannula also applies for the E-Catheter. Its outstanding visibility under ultrasound monitoring means an increase in safety for the anaesthetist during position control. The SelfPriming System (patent pending) is also responsible for this.

### SelfPriming System

In addition to the central opening, the E-Catheter also has a lateral opening, i.e. when injecting the anaesthetic; it also flows between the outer wall of the catheter and the inner wall of the indwelling cannula.

The E-Catheter has outstanding echogenic properties as a result of this SelfPriming System (patent pending).

### Outstanding visibility

-

A glance at the ultrasound image clarifies: Thanks to the liquid layer between the catheter and indwelling cannula, the E-Catheter also develops optimum echogenic properties so that its position can be clearly identified.

### Continuity of the nerve block

As a result of the additional lateral opening, the discharge of anaesthetic is then also guaranteed when the central opening of the catheter is blocked with tissue, for example.

## Innovative catheter fixation FixoLong and FixoCath – ensure mobility

With FixoLong and FixoCath, PAJUNK<sup>®</sup> offers two solutions for more mobility. They prevent especially during the continuous application that the catheter is accidently pulled out when the patient moves, or the supply of the anaesthetic interferes with an unfavourable position.

### FixoLong

With FixoLong, the catheter and filter are fixed close to the catheter exit, enabling greater freedom of movement in all continuous applications.

### FixoCath (optional)

FixoCath is wound dressing and fixation at the same time and is applied directly at the exit point. Here also a maximum of mobility for the patient is ensured.

## Filter 0.2µm

The  $0.2\,\mu\text{m}$  bacterial filter prevents the passage of bacteria.

### **Optional fixation of E-Cath with FixoCath**

- 1. Adhesive strip of the FixoCath is removed and applied at the patient

2. Catheter is placed at the

center of FixoCath

- Adhesive strip of the overlapping patch is withdrawn and the catheter is fixed
- FixoCath can be fixed additionally with a translucent patch

## Plexus anaesthesia The systems at a glance

						Filter 0.2 µm	FixoLong
Product	SonoPlex cannula	E-Catheter	Indwelling cannula	ltemNo.	PU
